The Gastrointestinal System Springer

The gastrointestinal tract is a long, muscular tube responsible for the digestion of food, assimilation of nutrients and elimination of waste. This is achieved by secretion of digestive enzymes and absorption from the intestinal lumen, with different regions playing specific roles in the processing of specific nutrients. These

regions come into play sequentially as ingested material is moved along the length of the GI tract by contractions of the muscle layers. In some regions like the oesophagus transit is rapid and measured in seconds while in others like the colon transit is measured in hours and even days, commensurate with the relative slow fermentation that takes place in the large bowel. An hierarchy of controls, neural and endocrine, serve to regulate the various cellular targets that exist in the gut wall. These include muscle cells for contraction and epithelial cells for secretion and

absorption. However, there are complex interactions between these digestive mechanisms and other mechanisms that regulate blood flow, immune function, endocrine secretion and food intake. These ensure a fine balance between the ostensibly conflicting tasks of digestion and absorption and protection from potentially harmful ingested materials. They match assimilation of nutrients with hunger and satiety and they ensure that regions of the GI tract that are meters apart work together in a coordinated fashion to match these diverse functions

to the digestive needs of the individual. This ebook will provide an overview of the neural mechanisms that control gastrointestinal function. This second edition provides 2400 multiple choice questions on human anatomy and physiology, and some physical science, separated into 40 categories. The answer to each question is accompanied by an explanation. Each category has an introduction to set the scene for the questions to come. However, not all possible information is provided within these Introductions, so an Anatomy and Physiology textbook is an indispensable aid to understanding the answers. The questions have been used in end-of-semester examinations for undergraduate

anatomy and physiology courses and as such reflect the focus of these particular courses and are pitched at this level to challenge students that are beginning their training in anatomy and physiology. The question and answer combinations are intended for use by teachers, to select questions for their next examinations, and by students, when studying for an upcoming test. Students enrolled in the courses for which these questions were written include nursing, midwifery, paramedic, physiotherapy, occupational therapy, nutrition and dietetics, health sciences, exercise science, and students taking an anatomy and physiology course as an elective.

This book provides the reader with a range of questions and explanations related to essential aspects of the neural, hormonal and gastrointestinal physiology. The focus of the book is on understanding the homeostatic control in each system by using questions to challenge the reader to think through physiology. In addition, functional integration of the different organ systems is highlighted in an area such as neuroendocrinology and in the study of the neural mechanisms in the gastrointestinal tract. This is the second Physiology Question-Based Learning book, written by Prof. Dr. Cheng. He has taught physiology for thirty years. He has pioneered the international physiology quiz, which is now an annual event at the University of Malaya in Kuala Lumpur, Malaysia and at universities around the world. As quiz master, he has designed challenging questions to test concepts and understanding in physiology. This book reflects the style of questions asked
